

CollectPoint eBOX and PayPoint SelfAWB Integration

Collect Point is an option for the delivery of products ordered online to the PayPoint Colet Expres convenience stores that are part of the PayPoint network.

This integration can be used only by clients who have entered into an agreement with FAN Courier.

To get the list of CollectPoint locations, you have to access the web address

https://www.selfawb.ro/export_locatii_collect_point_integrat.php by using the HTTP POST method with the following variables (in lowercase):

- **username** – username used to log into the SelfAWB application
- **user_pass** – password used to log into the SelfAWB application
- **client_id** – unique for each branch; can be found on the left side of the SelfAWB after logging into the application
- **address** – can be left blank
- **type** – for eBOX locations, please fill out with “**ebox**”; for PayPoint locations, please fill out with “**collect_all**”

For type = ebox, the script will generate a .csv file containing all eBOX locations in Bucharest.

For type = collect_all, all PayPoint locations in the FAN Courier system will be returned.

After obtaining the .csv file, you can implement it on your site as a dropdown with county, city/village -> display eBOX or PayPoint points in the respective city/village, or as a map on which the location pins will be displayed depending on the address entered by the client, using the points' geolocation from the obtained .csv file.

To generate AWBs, you need to access the web address https://www.selfawb.ro/import_awb_integrat.php by using the HTTP POST method, with the following variables (in lowercase):

- **username** – username used to log into the SelfAWB application
- **client_id** – unique for each branch; can be found on the left side of the SelfAWB after logging into the application
- **user_pass** – password used to log into the SelfAWB application
- **file** – this is the file containing data on shipments to be imported; the file is created according to the AWB import template in the FAN application and may contain one or more records (shipments); the file can be downloaded from the SelfAWB application -> AWB -> Import AWB.

For **eBOX**, the .csv file has the following properties:

- Service type: CollectPoint
- Options: H
- For the “county”, “city/village”, “street” and “postal code” fields, the information will be taken from the .csv file containing location details
- The fields “package height”, “package width” and “package length” must be filled out.
- eBOX is currently available only in Bucharest
- The e-mail field is mandatory

* The service CollectPoint Cont Colector cannot be used with an eBOX, because devices are not equipped with means of payment.

- Each eBOX terminal contains 47 boxes with the following sizes: S, M, L.
- The package must fall within the following sizes:
 - S – 8x44x61 cm
 - M – 17.5x44x61 cm
 - L – 36.5x44x61 cm
- The maximum permissible weight is 30 kg.
- Each generated AWB will include maximum one package; no multiple shipments are allowed.

AWB generation with delivery to PayPoint locations

For **PayPoint**, the .csv file has the following properties:

- Service type: CollectPoint or CollectPoint Cont Colector
- Options: F
- For the “county”, “city/village”, “street” and “postal code” fields, the information will be taken from the .csv file containing location details
- The e-mail field is mandatory
- The maximum cash on delivery amount accepted for PayPoint shipments is 1000 lei.
- The maximum permissible sizes are 60x90x60 cm.
- The maximum permissible weight is 10 kg.
